- TIFF Combiner TIFFmerge.exe is designed to take two or more single or multipage TIFF files and combine them into one. The simple command line parameters for Tiff Combiner are: 1) [-b] [-c] [-h] [-m] [-o] [-s] [-t] [-y] [-z] The specification of the source folder, the output folder, the target folder and the merge folder. The TIFF selector can be used to choose between single, multipage and merged TIFF files. (You can also specify that a TIFF file is not to be merged. This option, though, cannot be selected if the -m option is specified). After merging all the tiffs in the selected set of source files, the file is written to the target folder. All input and output files are written with the same name and with the same extension and the resulting file is written to the target folder. Tiff Combiner Notes: Tiff Combiner has a few limitations: it can only deal with jpegs in the tiff format and it does not work with TGA or DDS files. If you are unsure about any of the options you will need to read the help file that appears after typing tiffmerge. First, choose the type of input: - You can select either'single' or'multipage' tiffs. - If you select a'multipage' tiff then all the input tiffs have to have been saved as a single tiff. With a multipage tiff, you specify only the inputs you want merged and you then specify the output file. - To merge'single' tiffs, you can specify a tiff selector file. This is a simple text file and it is used to select from all the input files. The tiff selector file is named tiffselector. If you have more than one tiff saved in this file, it is to be specified seperately for each tiff file. - When you have tiffs saved in a selector file, Tiff Combiner requires you to specify the source folder. This is the folder from which the tiff selector file will be read. After you select a folder, you can optionally choose to combine all the selected tiffs in the output file. Selecting 'all' will result in
