Nope, I didn't mean to get rid of the driver. When I try to add a new onde file from the menu 'Add Hardware' driver I can't see a folder with that name in the "Device Drivers" category. What a dumb screen I am. Most of the files I try to open in explorer simply bring up UAC prompt asking if I want to open in anyway. A: "can not be reached" means that the device driver for this hardware is not present on the current computer. But still you have no way to fix the problem yourself, so I have to give you suggestions: Your easiest way to fix this problem yourself is to download the latest driver from the manufacturer's website. The instructions on the manufacturer's website should allow you to bypass the UAC prompt. If for some reason the instructions don't work, you can probably try to use the Windows Device Manager (in the Start menu, search for device manager, right-click on device manager and click show all devices) and see if there are any drivers listed for that hardware. Good luck! Q: Why do I get error when referencing multiple CSV files as SQLite Database? For an assignment I have to use SQLite Database and I'm having trouble in referencing multiple CSV files as my table. Basically I have 4 SQLite databases. One for user database (with primary key as username), one for the profile, one for the job, and one for the resume. Each of these are separate files. Whenever I use "SELECT * FROM user" to retrieve data from the user database, I get the user's ID as the primary key. The problem I have is whenever I insert data into the profile, job, and resume tables, they all insert the same data into the user database. I have no idea how this could happen. Any help is appreciated, thank you. Here's the part of the code that I'm having trouble with (the user, profile, resume, and job tables are included in this snippet). I have to use a single query to insert/update data from any table to the database. with open("/home/rannaug/Desktop/resume") as csvfile: if csvfile.closed: print("Failed to open the CSV file") sys
