The present invention relates to a photodetector comprising a semiconductor body comprising a surface portion from which an emissive semiconductor layer extends towards the surface and a bulk portion comprising a type II or type I/II superlattice structure, the superlattice structure comprising periodically present non-single-phased regions of the type II material with a higher refractive index than the type I material, adjacent regions of the superlattice structure have single-phase type I or type II material, a near-surface region of the superlattice structure and a region of the bulk portion, adjoining the superlattice structure. The invention also relates to a superlattice structure and a method of fabricating a superlattice structure. Superlattice structures comprise a semiconductor material, the majority charge carriers of which are located in a small number of layer planes arranged periodically. The structure may have a single-phase structure, meaning that each layer plane contains the same material, or a mixed phase structure, meaning that different layers in the structure contain different materials. Superlattice structures may be used for e.g. solar cells, light-emitting devices, and as active layers in electronic devices. A superlattice structure in which the single phase material comprises a semiconductor material may be obtained by depositing a thin film of a first semiconductor material, typically type II material, with a superlattice structure, of type II material, (typically type I/II material) on a substrate, and then removing the first material by etching to leave a superlattice structure, with the majority charge carriers of the type II material in each layer plane of the superlattice structure. It is difficult and expensive to obtain a high-quality epitaxial growth of a semiconductor material in many industrial processes. Since it is known that the best materials for most applications have good crystalline properties, superlattice structures are preferably fabricated by depositing good materials, and then removing the materials that are not required in
