as mentioned above, the analyzed cane sugars for direct consumption were divided into two groups with reference to their color. the first group consisted of 14 samples of brown sugars and the second group consisted of 5 samples of yellow sugars. the color, ash content, and starch content in brown and yellow sugars are presented in table 4. starch content in various types of cane sugars as a criterion of quality and authenticity all authors maciej wojtczak, aneta antczak & krystyna lisik published online:08 november 2013 table 4 the content of color, ash, and starch in commercial unrefined cane sugars for direct consumption (n=2) download csv display table if particles are not completely filtered out during the refining process, they remain in refined white cane sugar. traces of impurities in refined white cane sugar, which pass through the refiner in the form of particles, are removed by the final clarifier. during the clarifying process, white cane sugar granules wash over a special clarifier, and the impurities are removed. during clarifying, white cane sugar is converted into almost pure sucrose, which is the main product of the refining process.[4] the content of starch in white cane sugar is regulated by codex alimentarius, whereas there are no european regulations for this kind of sugar.[2] six grades of white cane sugar are distinguished: very low polarization (vlp), very low polarization (vl), low polarization (lp), high polarization (hp), very high polarization (vhp), and ultra-high polarization (uhp). table 3 shows typical values of analyses of polarization, moisture, reducing sugars, ash, color, and the content of polysaccharides, such as starch and dextran for various grades of white cane sugar. the content of starch in white sugar significantly influences the filterability of sugar solutions, which is very important for industrial sugar users, for instance, beverages producers. it should be stressed that, from the point of view of an individual consumer, traces of starch in refined white cane sugar are of very slight significance. for the sake of comparison, the content of starch in some samples of beet sugar was also determined; in none of them was any starch was found (table 3). the absence of starch in beet sugar makes it possible to treat the presence of starch in sugar as one of the criteria of identifying its origin. starch content in various types of cane sugars as a criterion of quality and authenticity all authors maciej wojtczak, aneta antczak & krystyna lisik published online:08 november 2013 table 3 the average value and standard deviation (sd) for color, ash content, and starch content for two types of cane white sugars and beet white sugar download csv display table

Icumsa Methods Book Free Download

i have used your book to prepare a report for a stakeholders meeting. the report presents a review of the sulphite and iodine refining process, the role of the control procedure and the content of the main ingredients, which affect the quality and safety of the final product. following the introduction and method to prepare the sugar-free product, the report has a chapter on the analysis of sugar properties, the general guidance to perform this method, and the major instructions on how to conduct the analysis. finally, the book presents the validation details. the content of the ash and starch for the analyzed samples is presented in table 4. it should be emphasized that for the sake of comparison the literature data for different raw materials are also presented. the literature data for the analyzed samples were published as reference values in the literature and they are marked with the letter "(ref)". the table also presents the analytical results for the analyzed samples and the literature data. it is clearly visible that in all samples of sugar analyzed the content of the ash is higher than the values published in the literature. the data for the ash content for the analyzed samples can be found in table 5. the content of ash in beet sugar is very close to the values published in the literature. although the analysis method is standardized in the icumsa methods book, the analytical results can differ with the method used and the laboratory. the content of impurities and colour in white cane sugar are presented in table 6. this table also presents the limit values for selected impurities; in some analyses the values for iodine are lower than the given limit values. beet sugar is white when the glucose content is equal to or above 96%. the carbohydrates contain 96% gluconic acid, which is a precursor of glucose. in the very high molecular weight compounds, the glucose consists of 100% "glucan" (polyglucose). 5ec8ef588b
