Here's the first of several photo-editing workflows you can use right out of the box with OS X 10.15 Catalina and a much better workflow than you can get now with Homebrew, which remains my favorite OS-level photo editor. To get the best results from any image editing app, keep the following workflow in mind: Adobe has retained the built-in ability to develop CR2 RAW images from files developing on cameras other than the Mac. I've found that the built-in Apple cameras produce the best CR2s. The point and shoot cameras, like the Fujifilm X-A3, are noticeably noisier than the Apple cameras I've tried, but the X-T2's Fujifilm X-Trans RAW converter can soften the noise sufficiently for my purposes. I've found that, right after the basics are set in RAW Develop, I use Noise Ninja with the Highlights Remove feature turned on. After using Noise Ninja's Highlight Remover for a month, I've never gone back to the built-in feature. It still detracts from the overall quality of the image. It's a cropper that I've never been able to get rid of and I've tried dozens of different settings. Elements may not be the best choice for Windows enthusiasts who are used to using a full-blown professional graphics package. However, it's the best alternative for consumers on a budget, and otherwise, the only choice. Since one of the base problems with a lot of free image editing software is the inability to edit more than one image at once, Adobe has identified that and engineered Elements to address that issue by featuring a mechanism that lets you save a project as a "Cloud" document. (Adobe has also developed yet another Pixelmator alternative called Sketch. See my review of Sketch here.)
